## Report for:

# New Forest District Council 

# Demographic Projections 

Final Report

July 2017

## Contents

Summary ..... 1

1. Introduction ..... 5
2. Population Trends ..... 7
3. New Forest Demographic Projections ..... 17
4. Older Persons Housing Needs ..... 41
Appendix 1: Additional Projection Outputs ..... 49
Appendix 2: Detailed Population Projection Outputs ..... 55

## Summary

## Introduction

1. Justin Gardner Consulting (JGC) have been commissioned by New Forest District Council to develop a series of demographic projections for each of three geographic sub-areas of the New Forest district comprising the local plan area outside of the New Forest National Park. The study also reviews the projected growth in the older population of the area, and the likely future need for housing and other forms of sheltered or care accommodation for older people.
2. The map below shows the geographical extent of the study area and the three sub-areas within the planning authority area. For clarity, the three sub-areas used in analysis are:

- Avon Valley \& Downlands
- South Coastal Towns
- Totton \& the Waterside

## Population Trends

3. Analysis of past trend data reveals that the population of the New Forest (planning authority area) has grown fairly modestly over the past decade (2005-15); over this period the population grew by $4.4 \%$, compared with $9 \%$ regionally and $8 \%$ nationally. The South Coastal Towns sub-area saw stronger population growth than other areas, increasing by $7.4 \%$ over the decade.
4. Population growth in the district is largely driven by net in-migration; the district consistently seeing a negative level of natural change (i.e. more deaths than births). The negative natural change is driven by the older age structure in the area, which saw $27 \%$ of the population aged 65 and over in 2015 (in the planning authority area) - this proportion is substantially above that seen in either the South East (19\%) or England (18\%). The age profile of the South Coastal Towns is particularly 'old', with $36 \%$ of the population being aged 65 and over.
5. Further analysis shows that the older person population has grown substantially over the decade to 2015; the population aged 65 and over increasing by $23 \%$, against a backdrop where total population growth was only $4.4 \%$

## New Forest Demographic Projections

6. The main analysis in this report was to develop a series of projections linked to different assumptions. Three projections were developed, two based on demographic-trends and one linking to the Council's housing trajectory. For all of these projections a full set out outputs around population growth, age structure, the components of population change, household growth and housing need has been provided. The projections covered the period from 2016 to 2036.
7. The first projection linked to the assumptions in the 2014-based subnational population projections (SNPP). It was observed that ONS are projecting for population growth to be somewhat above past trends, with assumptions about future migration also being higher than has typically been observed in the past. Overall, this scenario (PROJECTION 1A) showed population growth of 18,900 people across the district (excluding the National Park) and 11,700 additional households (which would translate into a need for 601 additional dwellings each year). Population and household growth was projected to be particularly strong in the Totton \& the Waterside area.
8. The second projection (PROJECTION 1B), looked at past trends in population growth (2005-15) and modelled data on the assumption that these average trends would be repeated in the future. This projection shows a more modest increase in the population and a greater focus on population growth in the South Coastal Towns sub-area. In terms households, this projection suggested a more even split of growth and housing need (relative to the current number of households in each area). Overall, this scenario suggested a need for around 483 dwellings per annum.
9. The final projection (PROJECTION 2) used information from the Council's housing trajectory to model what level of population growth might occur if housing delivery comes forward as expected. Across the planning authority area, this projection sees population growth somewhere in-between that shown by the two trend-based projections, but with some notable year-on-year variations. Overall, this scenario projects a population growth of around 14,900 people, with housing delivery of around 10,600 dwellings, or 530 dwellings per annum.
10. The figure and table below show a) a comparison of the population growth in each of the scenarios (plus a past trend analysis) and b) estimates of the housing need associated with each scenario and by sub-area. Figures are all for the New Forest planning authority area (i.e. excluding that part of the district that falls in the National Park).

Figure 3: Annual housing need with different scenarios by sub-area (2016-36)

|  | PROJECTION 1A | PROJECTION 1B | PROJECTION 2 |
| :--- | :---: | :---: | :---: |
| Avon Valley \& Downlands | 132 | 87 | 143 |
| South Coastal Towns | 58 | 169 | 119 |
| Totton \& the Waterside | 411 | 227 | 267 |
| New Forest (ex. NP) | 601 | 483 | 530 |

Source: Demographic projections

## Older Persons Housing Needs

11. The final section of the report has looked at the potential need for specialist housing for older people. This analysis updates information provided in the 2014 Strategic Housing Market Assessment (SHMA).
12. The older person population of the New Forest is proportionately larger than in a range of comparator area (Hampshire, the South East and England), with a particular concentration in older age groups (aged 75+) and the South Coastal Towns sub-area. The older person population is also projected to increase notably in the future, although increases are projected to be of a lesser scale than in other areas (partly linked to the New Forest already having a larger older person population).
13. The main analysis focussed on looking at future need for specialist housing (sheltered/extra-care) linked to the projections developed in this report. Using assumptions from the Housing and Learning Information Network (Housing LIN) it was estimated that there is a need for 2,175 additional units of older person specialist accommodation (in a C3 use class) in the 2016-36 period, along with 970 registered care bedspaces (C2 use class) - the first of these figures represents around a fifth of the housing being proposed through the housing trajectory.

Figure 4: Projected need for specialist housing for older persons by sub-area (2016-
36)

|  |  <br> Downlands | South Coastal <br> Towns | Totton \& the <br> Waterside | New Forest <br> (ex. NP) |
| :--- | :---: | :---: | :---: | :---: |
| Sheltered - affordable | 156 | 202 | 361 | 719 |
| Sheltered - market | 246 | 318 | 570 | 1,134 |
| Extra-care - affordable | 44 | 56 | 101 | 201 |

## 1. Introduction

1.1 Justin Gardner Consulting (JGC) have been commissioned by New Forest District Council to develop a series of demographic projections for each of three geographic sub-areas of the New Forest district comprising the local plan area outside of the New Forest National Park. The study also reviews the projected growth in the older population of the area, and the likely future need for housing and other forms of sheltered or care accommodation for older people.
1.2 Two main types of projection have been developed, the first being based on trend data using then latest information from the Office for National Statistics (ONS) and the second based on the proposed submission draft local plan housing target (and the phasing of this target). As will be seen in the analysis to follow, two 'trend-based' projections have been developed, along with one linked to the housing trajectory.
1.3 All projections have been developed for the period 2016-2036, to be consistent with the emerging Local Plan. Full spreadsheets of data have been provided to the Council with detailed information for each year and by sex/single year-of-age. This report contains key outputs from the projections, including:

- Age and sex breakdowns
- Estimates of the components of population change (i.e. migration and natural change (births minus deaths)
- Estimated household growth and dwelling need (linked to the trend-based projections)
- Data separately for each of the three sub-areas (as well as indicative information for the National Park part of the District in the case of trend-based projections)
1.4 The map below shows the geographical extent of the study area and the three sub-areas within the planning authority area. The map also shows the full extent of the National Park and Census Output Areas (OAs) that are either partially or fully within the sub-areas. One of the difficulties in studying National Parks is that the geographies do not align to standard statistical areas. Hence some detailed mapping was undertaken to consider the relationship between OAs and the three subareas, with a further estimate of the proportion of the population in 'partial' OAs being developed to enable estimates of population (and other characteristics) to be developed at a sub-area level.
1.5 It is considered that this method should provide a reasonably accurate view of the population profile in each area. To assist with this, the OA analysis has also ensured a consistency between ONS midyear population estimates (MYE) for both the New Forest District and the New Forest National Park (including looking at OAs outside of the District boundary). Hence all trend data has been consolidated to published data to ensure a consistency of approach across locations.

Figure 1.1: Map of New Forest sub-areas used in analysis

## 2. Population Trends

## Introduction

2.1 This section looks at a series of trend-based data about past population growth (split into the three sub-areas). Some of this data is then taken forward into the projections. As will be seen, some data is only available at a local authority level and this does add to the degree of assumption needing to be made when looking at developing analysis for smaller areas.

## Overall population change

2.2 The analysis below looks at population change in the period back to 2002. This date is chosen as it is the earliest date for which ONS have published MYE for OAs - population data for 2001 is available for OAs from the 2001 Census, but this data is not a 'mid-year' figure and therefore not strictly comparable. Whilst data is available from 2002, much of the analysis focusses on trends over the past 10-years (2005-15); this is due to a 10-year period having become an 'industry-standard' when looking at population trends.
2.3 The figure below shows population growth in the New Forest (excluding the National Park) and a range of comparator areas. This analysis shows that since 2005, New Forest (ex. NP) has seen more modest population growth than other areas, population increasing by $4 \%$, compared with $7 \%$ across Hampshire, $9 \%$ in the South East and 8\% nationally.

Source: ONS
2.4 The table below shows the actual population figures used in the analysis - this also includes data for each of the three sub-areas and focusses on the 10-year period to 2015. The analysis shows that population growth was strongest in the South Coastal Towns sub-area (increasing by over 7\%); this compares with population growth of less than $3 \%$ in each of Avon Valley \& Downlands and Totton \& the Waterside, and growth of just $1.4 \%$ in the National Park area of the New Forest District.

| Figure 2.2: Population growth (2005-15) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | 2005 | 2015 | Change | \% change |
| Avon Valley \& Downlands | 26,406 | 27,161 | 755 | $2.9 \%$ |
| South Coastal Towns | 47,213 | 50,689 | 3,476 | $7.4 \%$ |
| Totton \& the Waterside | 66,663 | 68,588 | 1,924 | $2.9 \%$ |
| New Forest (ex. NP) | 140,282 | 146,438 | 6,155 | $4.4 \%$ |
| New Forest NP | 32,141 | 32,586 | 445 | $1.4 \%$ |
| District total | 172,423 | 179,023 | 6,600 | $3.8 \%$ |
| Hampshire | $1,263,075$ | $1,353,043$ | 89,968 | $7.1 \%$ |
| South East | $8,202,896$ | $8,947,913$ | 745,017 | $9.1 \%$ |
| England | $50,606,034$ | $54,786,327$ | $4,180,293$ | $8.3 \%$ |

Source: ONS
2.5 The figure below shows the indexed population growth in each area of the New Forest. This again shows that the South Coastal Towns area has seen substantially stronger growth than other parts of the District.

Source: ONS

## Components of past population change

2.6 The figure and table below consider the drivers of population change in New Forest District from 2001 to 2015. This information (from ONS) is only readily available for the whole District (including the National Park area).
2.7 Population change is largely driven by natural change (births minus deaths) and migration although within ONS data there is also a small other changes category (mainly related to armed forces and prison populations) and an unattributable population change (UPC) - this is an adjustment made by ONS to mid-year population estimates where Census data has suggested that population growth had either been over- or under-estimated in the inter-Census years. Because UPC links back to Census data a figure is only provided for years up to 2011.
2.8 The figure shows in New Forest that net migration has been the key driver of population change. Throughout the period studied, the number of deaths exceeded the number of births. Over the full 2001-15 period, the number of births was (on average) 480 lower than the number of deaths each year. When looking at migration, the data shows an average level of net migration of about 1,320 people per annum (with about 1,050 of this being internal migration (i.e. net moves from another part of the Country). Levels of migration have generally been lower over the past five years; in the 201015 period, net migration averaged 1,060 people per annum, with a figure of 1,250 if looking at the past 10-years (2005-15).
2.9 Other changes are quite small and the data also shows a negative level of UPC. This latter finding would suggest that ONS may have previously over-estimated migration and population growth in New Forest.

## Population age structure

2.10 The table below shows the population profile of New Forest (ex. NP) in five-year age bands compared with a range of other areas. The data shows a relatively old age structure with particularly notable differences from ages 60 onwards.

| Figure 2.6: Population profile (2015) |  |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | New Forest (ex. NP) |  |  |  |  |  | Hampshire | South East | England |
|  | Population | \% of population | \% of population | \% of population | \% of population |  |  |  |  |
| Age 0-4 | 7,370 | $5.0 \%$ | $5.7 \%$ | $6.1 \%$ | $6.3 \%$ |  |  |  |  |
| Aged 5-9 | 7,775 | $5.3 \%$ | $6.0 \%$ | $6.2 \%$ | $6.1 \%$ |  |  |  |  |
| Aged 10-14 | 7,493 | $5.1 \%$ | $5.6 \%$ | $5.6 \%$ | $5.5 \%$ |  |  |  |  |
| Aged 15-19 | 7,603 | $5.2 \%$ | $5.8 \%$ | $5.9 \%$ | $5.9 \%$ |  |  |  |  |
| Aged 20-24 | 6,730 | $4.6 \%$ | $5.1 \%$ | $6.1 \%$ | $6.6 \%$ |  |  |  |  |
| Aged 25-29 | 7,065 | $4.8 \%$ | $5.5 \%$ | $6.0 \%$ | $6.9 \%$ |  |  |  |  |
| Aged 30-34 | 6,778 | $4.6 \%$ | $5.6 \%$ | $6.2 \%$ | $6.8 \%$ |  |  |  |  |
| Aged 35-39 | 7,119 | $4.9 \%$ | $5.8 \%$ | $6.3 \%$ | $6.3 \%$ |  |  |  |  |
| Aged 40-44 | 8,786 | $6.0 \%$ | $6.8 \%$ | $6.8 \%$ | $6.6 \%$ |  |  |  |  |
| Aged 45-49 | 9,952 | $6.8 \%$ | $7.4 \%$ | $7.3 \%$ | $7.1 \%$ |  |  |  |  |
| Aged 50-54 | 10,764 | $7.4 \%$ | $7.6 \%$ | $7.2 \%$ | $7.0 \%$ |  |  |  |  |
| Aged 55-59 | 9,769 | $6.7 \%$ | $6.6 \%$ | $6.1 \%$ | $6.0 \%$ |  |  |  |  |
| Aged 60-64 | 9,560 | $6.5 \%$ | $5.8 \%$ | $5.4 \%$ | $5.3 \%$ |  |  |  |  |
| Aged 65-69 | 11,202 | $7.6 \%$ | $6.4 \%$ | $5.8 \%$ | $5.5 \%$ |  |  |  |  |
| Aged 70-74 | 8,906 | $6.1 \%$ | $4.8 \%$ | $4.3 \%$ | $4.1 \%$ |  |  |  |  |
| Aged 75-79 | 7,233 | $4.9 \%$ | $3.8 \%$ | $3.4 \%$ | $3.3 \%$ |  |  |  |  |
| Aged 80-84 | 5,806 | $4.0 \%$ | $2.8 \%$ | $2.6 \%$ | $2.4 \%$ |  |  |  |  |
| Aged 85+ | 6,525 | $4.5 \%$ | $2.9 \%$ | $2.7 \%$ | $2.4 \%$ |  |  |  |  |
| All Ages | 146,437 | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ |  |  |  |  |

Source: ONS mid-year population estimates
2.11 The differences between New Forest and other areas can more clearly be seen in the figure below. This identifies a relatively low proportion of the population aged about 20 to 39 and higher proportions for all age bands from about 60 upward.

Source: ONS mid-year population estimates
2.12 The analysis below summarises the above information by assigning population to three broad age groups (which can generally be described as a) children, b) working-age and c) pensionable age. This analysis shows that New Forest (ex. NP) has a relatively high proportion of people aged 65 and over (27\%) and consequently lower proportions of both children and people of working-age.

| Figure 2.8: Population profile (2015) - summary age bands |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | New Forest (ex. NP) | Hampshire | South East | England |  |
|  | Population | $\%$ of population | $\%$ of population | $\%$ of population | \% of population |
| Age under 16 | 24,131 | $16.5 \%$ | $18.4 \%$ | $19.0 \%$ | $19.0 \%$ |
| Aged 16-64 | 82,635 | $56.4 \%$ | $60.9 \%$ | $62.2 \%$ | $63.3 \%$ |
| Aged 65+ | 39,672 | $27.1 \%$ | $20.7 \%$ | $18.8 \%$ | $17.7 \%$ |

| Source: ONS mid-year population estimates |  |  |  |  |  |

2.13 The table below shows the same information for each of the three sub-areas (plus the National Park area of the District). This shows clear differences between the different locations, with the South Coastal Towns having a substantially older age structure than any of the other areas (including the National Park). The youngest age structure can be seen in Totton \& the Waterside, although the population profile in this area is still relatively old in comparison with other areas (e.g. regionally and nationally).

| Figure 2.9: Population profile (2015) - summary age bands |  |  |  |  |  |  |

## Age structure changes

2.14 The table and figure below show population change by age (again for the 2005-15 period). This generally identifies the greatest increases to be in older age groups (aged 65 and over) along with some notable population declines (particularly in the 30-44 age group).

| Figure 2.10: Population change by age (2005-15) - 5-year age bands (New Forest |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Population NP)) <br> $(2005)$ |  |  |  |
|  | Population <br> $(2015)$ | Change | \% change |  |
| Age 0-4 | 6,659 | 7,370 | 711 | $10.7 \%$ |
| Aged 5-9 | 7,725 | 7,775 | 50 | $0.6 \%$ |
| Aged 10-14 | 8,600 | 7,493 | $-1,107$ | $-12.9 \%$ |
| Aged 15-19 | 8,194 | 7,603 | -591 | $-7.2 \%$ |
| Aged 20-24 | 5,954 | 6,730 | 776 | $13.0 \%$ |
| Aged 25-29 | 6,133 | 7,065 | 932 | $15.2 \%$ |
| Aged 30-34 | 7,605 | 6,778 | -827 | $-10.9 \%$ |
| Aged 35-39 | 9,431 | 7,119 | $-2,312$ | $-24.5 \%$ |
| Aged 40-44 | 10,375 | 8,786 | $-1,588$ | $-15.3 \%$ |
| Aged 45-49 | 9,406 | 9,952 | 546 | $5.8 \%$ |
| Aged 50-54 | 9,015 | 10,764 | 1,749 | $19.4 \%$ |
| Aged 55-59 | 10,212 | 9,769 | -443 | $-4.3 \%$ |
| Aged 60-64 | 8,682 | 9,560 | 879 | $10.1 \%$ |
| Aged 65-69 | 7,897 | 11,202 | 3,305 | $41.8 \%$ |
| Aged 70-74 | 7,467 | 8,906 | 1,439 | $19.3 \%$ |
| Aged 75-79 | 6,647 | 7,233 | 585 | $8.8 \%$ |
| Aged 80-84 | 5,666 | 5,806 | 140 | $2.5 \%$ |
| Aged 85+ | 4,613 | 6,525 | 1,912 | $41.4 \%$ |
| All Ages | 140,282 | 146,437 | 6,155 | $4.4 \%$ |

Source: ONS mid-year population estimates
2.15 This information has again been summarised into three broad age bands to ease comparison. The table below shows a decrease in the number of children living in the District (reducing by about 3\%) along with a modest decrease in the 'working-age' population. The key driver of population growth has therefore been in the 65 and over age group, which between 2005 and 2015 saw a population increase of about 7,400 people; this age group increasing in size by $23 \%$ over the decade.

| Figure 2.11: Change in population by broad age group (2005-15) - New Forest (ex. |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| NP) |  |  |  |  |

Source: ONS mid-year population estimates
2.16 The series of tables blow shows the same information for each of the three sub-areas, plus the National Park area of the New Forest District and an overall District-wide change in the population structure. All areas see a notable increase in the population aged 65 and over, and with the exception of the South Coastal Towns, a decline in the population aged 16-64 has been observed. The difference between the South Coastal Towns and other areas looks to have been driven by the overall higher level of population growth observed by ONS in their MYE.

| Figure 2.12: Change in population by broad age group (2005-15) - Avon Valley \& |  |  |  |  |

## Past household growth

2.17 The final analysis looks at changes in the number of households in each area. Unlike with the population data, ONS do not provide annual figures that can be split down into smaller sub-areas. Hence the analysis looks at changes of the decade between the 2001 and 2011 Census. Again a comparison has been made with other areas.
2.18 The analysis shows that between 2001 and 2011, the number of households in the New Forest (ex. NP) increased by around 4,500 - this is a $7.7 \%$ increase. This level of increase is slightly lower than observed in other areas, although the difference between locations is less stark than the comparisons for population growth (albeit the analysis has studied a different period).
2.19 At a smaller area level, the analysis shows the strongest household growth to have been in the South Coastal Towns (8.7\%) and the lowest in Avon Valley \& Downlands (5.1\%). The National Park area of the New Forest however saw even more modest household growth; the number of households shown to have increased by just $2.6 \%$ of the decade.

| Figure 2.17: Change in number of households (2001-11) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | 2001 <br> households | 2011 <br> households | Change | $\%$ change |

Source: 2001 and 2011 Census

## Summary

2.20 Analysis of past trend data reveals that the population of the New Forest (planning authority area) has grown fairly modestly over the past decade (2005-15); over this period the population grew by $4.4 \%$, compared with $9 \%$ regionally and $8 \%$ nationally. The South Coastal Towns sub-area saw stronger population growth than other areas, increasing by $7.4 \%$ over the decade.
2.21 Population growth in the district is largely driven by net in-migration; the district consistently seeing a negative level of natural change (i.e. more deaths than births). The negative natural change is driven by the older age structure in the area, which saw $27 \%$ of the population aged 65 and over in 2015 (in the planning authority area) - this proportion is substantially above that seen in either the South East (19\%) or England (18\%). The age profile of the South Coastal Towns is particularly 'old', with $36 \%$ of the population being aged 65 and over.
2.22 Further analysis shows that the older person population has grown substantially over the decade to 2015; the population aged 65 and over increasing by $23 \%$, against a backdrop where total population growth was only $4.4 \%$

## 3. New Forest Demographic Projections

## Introduction

3.1 As part of this assessment a number of projections to assess how the population might change under different assumptions have been run. Three core projections have been developed (two based on demographic trends and one based on linking population growth to a housing trajectory. Core outputs from these projections are provided in this section with a summary of the projections being listed below - more detailed information has been provided to the Council in spreadsheet form:

- PROJECTION 1A (Demographic-based - linked to the latest (2014-based) subnational population projections (SNPP) and 2014-based CLG household projections);
- PROJECTION 1B (Demographic-based - linked to population growth trends in the 10-year period from 2005-15); and
- PROJECTION 2 (Housing Trajectory - based on a phased housing trajectory distributed by subarea)
3.2 Two different trend-based projections have been run as it is difficult to provide an accurate sub-area projection in the absence of information about past components of population change (particularly migration). Hence Projection 1A assumes the migration rates in the SNPP (suitably adjusted for age structure differences) with Projection 1B linking to the actual level of population growth seen in the past.
3.3 As will be seen, the trend-based assumptions used can have a significant impact on the outputs; this is particularly the case in the South Coastal Towns where the older age structure leads to lower levels of population growth (due to the excess of births over deaths) but where this area has seen the strongest growth over the past 10-years. The two trend-based projections should therefore be viewed as a range although for the purposes of this study it is considered that the housing trajectory projection should be the main projection used when assessing the study outputs.

## Methodology

3.4 The methodology used to determine population and household growth is based on a fairly standard population projection methodology consistent with the methodology used by ONS and CLG in their population and household projections. Essentially the method establishes the current population and how will this change in the period from 2016 to 2036. This requires working out how likely it is that women will give birth (the fertility rate); how likely it is that people will die (the death rate) and how likely it is that people will move into or out of each area. These are the principal components of population change and are used to construct population projections. The figure below shows the key stages of the projection analysis through to the assessment of housing requirements.

3.5 For the projection linked to housing targets, the methodology essentially works in reverse; with a housing figure inserted at the bottom and the modelling working back to the size of population expected for this level of housing to be occupied.
3.6 The series of analyses below describe some of the key inputs to the modelling, before continuing to show key outputs from the three scenarios developed.

## Fertility and Mortality Rate Assumptions

3.7 For modelling of fertility and mortality the rates contained within the ONS 2014-based subnational population projections (SNPP) for New Forest District have been used. Given that the planning authority area of the District contains about $82 \%$ of the total population, it seems reasonable to assume that the District-wide assumptions will also broadly apply to this area.
3.8 Adjustments for smaller areas were also considered (based on looking at ONS Output Area birth and death statistics), however there was no strong evidence that either fertility or mortality could be expected to vary substantially from the District-wide position in terms of the rates for any given age group; this is particularly the case for the forward projections where there is clearly some uncertainty. That said, it is not considered that birth or death rates will be the main driver of population change moving forward.
3.9 For information, the analysis of births and deaths suggested a small level of negative natural change (i.e. more deaths than births) in Avon Valley \& Downlands, a much larger negative figure in South Coastal Towns, and a small positive figure for Totton \& the Waterside. These past trends (which are based on data for the 2001-14 period) should be borne in mind when considering the detailed outputs from the modelling to follow.

## Migration Assumptions

3.10 For the purposes of understanding the profile of migrants, data has again been drawn from the ONS 2014-based sub-national population projections. The figure below shows the profile of in- and outmigrants by age linked to the 2014-based SNPP. This projection sees an average level of net inmigration of 1,683 people per annum (made up of 9,235 in-migrants and 7,552 people moving out).
3.11 To assign a migration profile to the different sub-areas, account has been taken of the age structure in each location. District-wide estimates of both in- and out-migration (and by age/sex) have been separately developed; where an area has a greater proportion of a particular age group, it is assumed that a greater proportion of the district migration (for that age group) will be assigned to that area. In doing this it is considered that a reasonable view about migration profiles can be developed (and this is used in PROJECTION 1A). Such an approach does not however directly link to actual past levels of migration as small-area migration is not measured by ONS; however, by using information about past population growth a trend-based projection can be developed which will have higher or lower estimates of migration than in the initial modelling (this is PROJECTION 1B).

Source: Derived from ONS 2014-based subnational population projections
3.12 When projecting migration patterns for the various projection scenarios the migration profile has been used along with adjusted levels of in- and out-migration to match the requirements of each scenario (e.g. when testing what level of migration is required to support the level of housing growth suggested in the trajectory). This approach has consistently been adopted across all analysis.

## Institutional Population

3.13 Modelling the data using assumptions about birth/death rates and migration, leads to estimates of how the population profile will change in the future; from this, estimates of likely household growth can be determined. Prior to converting population into households, an estimate of the number of people who live in institutional accommodation needs to be estimated. This approach is used to ensure consistency with the method used by CLG in developing their household projections. Consistent with the approach taken by CLG, the projections for New Forest use 2011 Census data (which in this case has been split down into the 3 sub-areas plus the National Park).
3.14 The table below shows the number of people living in institutional accommodation in each sub-area. This shows that relative to population, the National Park area has some of the highest numbers. In projecting the institutional population forward, it has been assumed that the number of people aged up to 74 will remain the same and that the proportions of the population aged 75 and over will be roughly constant. This approach is consistent with that used by CLG in their projections.

| Figure 3.3: Institutional population by sex (2011) |  |  |  |
| :--- | :---: | :---: | :---: |
|  | Male | Female | Total |
| Avon Valley \& Downlands | 190 | 276 | 466 |
| South Coastal Towns | 253 | 641 | 894 |
| Totton \& the Waterside | 280 | 317 | 597 |
| New Forest (ex. NP) | 724 | 1,234 | 1,957 |
| New Forest NP | 440 | 573 | 1,014 |
| New Forest total | 1,164 | 1,807 | 2,971 |

Source: 2011 Census
3.15 The estimated size of the institutional population (by age/sex) in each year of the projection is removed from the total population to give a household population; this is then taken forward into the analysis of household growth. The institutional population is however included in all population data presented in this report, unless otherwise indicated. For example, all population data presented in the tables in Appendix 2 includes both the household and institutional population.

## Household Growth (Household Representative Rates (HRRs))

3.16 Having studied the population size and the age/sex profile of the population the next step in the process is to convert this information into estimates of the number of households in the area. To do this the concept of household representative rates (HRRs) is used. HRRs can be described in their most simple terms as the number of people who are counted as head of household (or in this case the more widely used Household Reference Person (HRP)).
3.17 On the $12^{\text {th }}$ June 2016, CLG published a new set of (2014-based) household projections - the projections contain two core analyses. The Stage 1 household projections project household formation based on data from the 1971, 1981, 1991, 2001 and 2011 Censuses with outputs for age, sex and marital status. For younger age groups (aged under 30 ) greater weight was given in the CLG projections methodology to shorter-term trends, although for all age groups the methodology takes account of a combination of longer- and shorter-term trends.
3.18 The Stage 2 household projections consider household types and the methodology report accompanying the projections is clear that these projections are based on just two data points - from the 2001 and 2011 Census. Overall outputs on total household growth are constrained to the totals from the Stage 1 Projections. This means that both sets of projections show the same level of overall household growth (when set against the last set of SNPP) but some of the age specific assumptions differ. Differences can however occur between the Stage 1 and 2 headship rates when modelled against different population projections (due to differences in the age structure).
3.19 Overall, it is considered that the Stage 1 projections should be favoured over the Stage 2 figures for the purposes of considering overall household growth; this is for two key reasons: a) the Stage 1 figures are based on a long-term time series (dating back to 1971 and using 5 Census data points) whereas the Stage 2 figures only look at two data points (2001 and 2011) and b) the Stage 2 figures are constrained back to Stage 1 values, essentially meaning that it is the Stage 1 figures that drive overall estimates of household growth in the CLG household projections themselves. The analysis to follow therefore focuses on Stage 1 figures.
3.20 The figure below shows how the Stage 1 and Stage 2 data differs for different age groups. It is evident from the analysis that HRRs amongst households in their late 20s and early 30 s fell slightly over the 2001-11 decade (albeit a continuation of the trend seen back to 1991). The (Stage 1) projections are however showing that formation will generally increase in the future. The 2014-based household projections also generally expect household formation rates amongst older age groups to fall over time. Given improving life expectancy this 'trend' looks to be reasonable (as it would be expected that more people would remain living as couples).

Figure 3.4: Projected household formation rates by age of head of household - New Forest District

|  |  |
| 55-64 | 65-74 |
|  |  |
| 75-84 | 85 and over |
|  |  |

Source: Derived from CLG data
3.21 For individual sub-areas in the New Forest, the Stage 1 figures are used as a start point, and these were then adjusted to reflect the number of households in each area. Estimates of households (in 2016) were based on a combination of 2011 Census data, combined with likely growth given population change in the 2011-15 period and a further projection of growth based on housing delivery from 2015-16. Moving forward, it is assumed that all age groups will see HRRs change in the same proportions as shown by the district-wide projections.
3.22 The table below shows the estimated number of households in each sub-area in 2016, along with estimated of the household population and hence average household sizes. The figures for the National Park area of the New Forest should be seen as indicative as no information about housing completions was used in the analysis, estimated figures for 2016 therefore being based on rolling forward the 2014-based SNPP (as used in PROJECTION 1A).

Figure 3.5: Estimated households, household population and average household size (2016)

|  | Households | Household <br> population | Average <br> household size |
| :--- | :---: | :---: | :---: |
| Avon Valley \& Downlands | 11,656 | 26,702 | 2.29 |

| New Forest total | 78,767 | 175,772 | 2.23 |

Source: Demographic Projections

## Vacant Dwellings

3.23 The information about household population and HRRs can be brought together to estimate how the number of households will change in the future. To convert households into dwellings the data includes an uplift to take account of vacant homes. This has been based on 2016 Council Tax Register (CTR) data with a summary of the key statistics shown below. This shows that the total number of dwellings is some $4.0 \%$ higher than the number of occupied homes (which is taken as a proxy for households) and hence household growth figures are uplifted by around $4.0 \%$ to provide an estimate of housing need. It is assumed that such a level of vacant homes will allow for movement within the housing stock and includes an allowance for second homes.

| Figure 3.6: Vacant homes (Council Tax data) |  |
| :--- | :---: |
|  | New Forest District |
| Dwellings | 81,094 |
| Second Homes | 1,718 |
| Other vacant homes | 1,401 |
| Total vacant | 3,119 |
| Total occupied | 77,975 |
| Vacancy allowance | $4.0 \%$ |

Source: CLG
3.24 To provide vacancy rate information for each of the three sub-areas (and the National Park), data has been drawn from the 2011 Census (data about occupied household spaces). This data has then been adjusted to take account of the overall vacancy rate derived from CTR data. The estimated proportions of vacant homes (as used in analysis) are shown below:

- Avon Valley \& Downlands - 3.2\%
- South Coastal Towns - 5.8\%
- Totton \& the Waterside - $1.8 \%$
- New Forest NP - 6.2\%

## Working-age population

3.25 Although not specifically required in terms of the specification for this project, it seems useful to also provide an indication of how the working-age population would be expected to change under each of the scenarios developed. The working age population is impacted not only by the age structure but also by changes to pensionable age. The box below summarises these changes.

The state pension ages (SPA) for people will change during the projection period. Between 2012 and 2018, SPA will change from 65 years for men and 61 years for women, to 65 years for both sexes. Then between December 2018 and October 2020, SPA will change from 65 years to 66 years for both men and women. Between 2026 and 2046, SPA will increase in two stages from 66 years to 68 years for both sexes. This is based on SPA under the Pensions Act 2014.
3.26 The outputs for the working-age population (and also the number of people of pensionable age) are not presented or discussed in the main body of the report; however, outputs for each of the projection scenarios can be found in Appendix 2.

## Projection Scenarios

3.27 The analysis below provides an overview of key outputs (around overall population and household growth) under each of the three scenarios developed. More detailed analysis on a year-by-year basis can be found in Appendix 2; this includes information about the projected components of population change (natural change and net migration). Additionally, more detailed outputs (by sex and single year of age) have also been provided in spreadsheet form to the Council.

## PROJECTION 1A - Trend-based linked to 2014-based SNPP

3.28 The first projection developed takes the information underpinning the 2014-based subnational population projections (SNPP) and 2014-based CLG household projections, and rolls this out based on local information about the age structure, institutional population, HRRs etc. Outputs are consolidated back to those in the respective 2014-based projections, with the addition of a rebasing to 2016 (which takes account of recorded population growth in ONS MYE and also the number of completions in 2015-16).
3.29 Initially, it is worth briefly reflecting on the SNPP, with the figure below showing past and projected population growth up to 2036. This analysis shows that projected population growth is somewhat higher than past trends. This is driven by ONS projecting for there to be a much higher level of net migration moving forward.
3.30 In the 2016-36 period, ONS suggests an average net migration of 1,683 people per annum, rising from 1,500 in 2016/17 to over 1,800 by 2035/36. All of these figures are some way above past trend analysis, which shows average net migration of 1,321 over the previous 14-years (2001-15), 1,246 over the past 10-years (2005-15) and 1,060 over the past 5 -years (2010-15). The period feeding into the 2014-based SNPP (2009-14 for internal migration and 2008-14 for international migration) showed an average net migration of 1,171 people per annum. It is not the purpose if this study to question the validity of official projections, but it should be noted that both projected population and migration are substantially above past trends.

Source: ONS
3.31 The table below shows population growth in each of the three sub-areas (plus the National Park area of the New Forest). Overall, the population is projected to increase by $13 \%$ over the 20 -year period (in the planning authority area). Much of this growth is projected to be in the Totton \& the Waterside area, this is due to this area having a relatively young age structure and therefore a higher level of natural change; the opposite can be observed in the South Coastal Towns area (which has a much older age profile).

| Figure 3.8: Population change 2016-36 - PROJECTION 1A |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Population <br> 2016 | Population <br> 2036 | Change in <br> population | \% change |
| Avon Valley \& Downlands | 27,199 | 30,961 | 3,762 | $13.8 \%$ |
| South Coastal Towns | 50,744 | 52,464 | 1,720 | $3.4 \%$ |
| Totton \& the Waterside | 68,232 | 81,607 | 13,375 | $19.6 \%$ |
| New Forest (ex. NP) | 146,175 | 165,032 | 18,857 | $12.9 \%$ |
| New Forest NP | 32,675 | 35,295 | 2,620 | $8.0 \%$ |
| New Forest total | 178,850 | 200,327 | 21,476 | $12.0 \%$ |

Source: Demographic projections
3.32 A similar analysis has been provided below for the projected change in the number of households; this largely follows the patterns of population change with a higher projected level of household growth in Totton \& the Waterside and much lower growth in South Coastal Towns. The final column of the table shows the estimated dwellings per annum that this level of population growth would imply.

| Figure 3.9: Household change 2016-36 - PROJECTION 1A |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | Households <br> 2016 | Households <br> 2036 | Change in <br> households | $\%$ change | Dwellings <br> per annum |
| Avon Valley \& Downlands | 11,656 | 14,207 | 2,551 | $21.9 \%$ | 132 |
| South Coastal Towns | 23,920 | 25,008 | 1,088 | $4.5 \%$ | 58 |
| Totton \& the Waterside | 29,226 | 37,310 | 8,084 | $27.7 \%$ | 411 |
| New Forest (ex. NP) | 64,802 | 76,525 | 11,724 | $18.1 \%$ | 601 |
| New Forest NP | 13,965 | 15,805 | 1,840 | $13.2 \%$ | 98 |
| New Forest total | 78,767 | 92,330 | 13,564 | $17.2 \%$ | 698 |

## PROJECTION 1B - Trend-based linked to population growth in the 2005-15 period

3.33 The second projection uses the same underlying data as in PROJECTION 1A but with a different approach to migration and population growth. Essentially, this projection looks at the overall and average population growth in the 2005-15 period (i.e. a 10-year period) and models what level of migration would be needed if this level of growth continued into the future. Modelling the relevant population change also allows for an estimate of the likely household growth and hence housing need.
3.34 The table below shows estimated population growth over the 2005-15 period - this data is repeated from earlier in the report. In terms of the modelling the following levels of population growth have been used over the 2016-36 period (a 20 -year period and therefore essentially double the change observed in the 2005-15 period):

- Avon Valley \& Downlands - 1,510 additional people
- South Coastal Towns - 6,952 additional people
- Totton \& the Waterside - 3,848 additional people
- New Forest NP - 890 additional people

| Figure 3.10: Population growth (2005-15) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | 2005 | 2015 | Change | \% change |
| Avon Valley \& Downlands | 26,406 | 27,161 | 755 | $2.9 \%$ |
| South Coastal Towns | 47,213 | 50,689 | 3,476 | $7.4 \%$ |
| Totton \& the Waterside | 66,663 | 68,588 | 1,924 | $2.9 \%$ |
| New Forest (ex. NP) | 140,282 | 146,438 | 6,155 | $4.4 \%$ |
| New Forest NP | 32,141 | 32,586 | 445 | $1.4 \%$ |

3.35 The figure below shows the population growth associated with this scenario, along with past trend data back to 2001. This shows a projected level of growth that is more in-line with past trends when compared with the 2014-based SNPP. The slight 'blip' shown for 2014-16 is due to a low level of population growth in the 2015 ONS MYE and the relatively low level of housing delivery in the 201516 period (which also has the impact of showing lower population growth).

Source: ONS and demographic projections
3.36 The table below shows population growth in each of the three sub-areas (plus the National Park area of the New Forest). Overall, the population is projected to increase by $8 \%$ over the 20 -year period (in the planning authority area). Much of this growth is projected to be in the South Coastal Towns area, this is due to this area having seen the strongest growth in the past. The opposite can mainly be seen in the National Park area of the district.

Source: Demographic projections
3.37 A similar analysis has been provided below for the projected change in the number of households; this shows that despite the differing levels of population growth, the proportionate growth in households is actually projected to be broadly similar across areas. This will be due to how the age structure is projected to change, in the South Coastal Towns for example, the higher level of projected population growth sees greater increases in the population of working-age (and their associated children); this has less of an impact on household growth than additional growth in the older person population (which is seen more strongly in areas with lower projected population growth). The final column of the table again shows the estimated dwellings per annum that this level of population growth would imply.

| Figure 3.13: Household change 2016-36 - PROJECTION 1B |  |  |  |  |  |

## PROJECTION 2 - Housing Trajectory

3.38 The third and final projection again uses the same underlying data as in PROJECTION 1 A but with a different approach to migration and population growth. This projection looks at the Council's housing trajectory for 2016-36 and models what level of population growth might be expected if homes are delivered as is currently expected. The modelling takes account of the phasing of delivery as well as the overall numbers. Again, modelling the relevant population change also allows for an estimate of the likely household growth and hence housing need.
3.39 The table below shows the housing trajectory used in the analysis. This shows a total delivery of 10,602 dwellings over the 2016-36 period, with around half of this expected to be in the Totton \& the Waterside sub-area. The figures are only for the three sub-areas of the planning authority area and do not include any equivalent data for the National Park area. To allow for district totals to be obtained, population/household figures from PROJECTION 1A have been used in the case of the National Park - this is just for the purposes of completeness and it would be equally relevant to use figures from PROJECTION 1B (or from a housing trajectory, were this to be available). In any case, given that this projection is largely looking at the planning authority area, it is not considered that this is a significant point for the analysis.

Figure 3.14: Housing Trajectory (2016-36)

|  |  <br> Downlands | South Coastal <br> Towns | Totton \& the <br> Waterside | Total (ex. NP) |

Source: New Forest District Council
3.40 The figure below shows the population growth associated with this scenario, along with past trend data back to 2001. This shows a projected level of growth that is quite variable over time, this is due to the variable nature in when the housing delivery is expected to occur. Overall, the trajectory scenario does again look to be more in-line with past trends than the 2014-based SNPP.

Source: ONS and demographic projections
3.41 The table below shows population growth in each of the three sub-areas (plus the National Park area of the New Forest). Overall, the population is projected to increase by $10 \%$ over the 20 -year period (in the planning authority area) - this is below the projected growth with the SNPP but above the modelling linked to 10-year migration trends. In proportionate terms, the strongest growth is projected in Avon Valley \& Downlands, this is linked to a relatively high level of delivery in the trajectory (relative to the current number of dwellings/households in the area).

| Figure 3.16: Population change 2016-36 - PROJECTION 2 |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |

| New Forest NP | 32,675 | 35,295 | 2,620 | $8.0 \%$ |
| New Forest total | 178,850 | 196,326 | 17,476 | $9.8 \%$ |

Source: Demographic projections
3.42 A similar analysis has been provided below for the projected change in the number of households; this is largely a direct link to the housing trajectory, with the number of households being slightly lower than delivery depending on the assumptions made about vacant homes in each area.

| Figure 3.17: Household change 2016-36 - PROJECTION 2 |  |  |  |  |  |

Source: Demographic projections

## Components of Population Change

3.43 Appendix 2 provides more detail sitting behind each of the projections (including estimates of births, deaths and migration). This section briefly picks up on some of this information to look at what is projected to be the main driver of population growth in the future. The data presented below is from PROJECTION 2 (Housing Trajectory) and clearly shows that natural change is projected to be negative throughout the projection period, and at an increasing level over time. Net migration is consistently positive, and is projected to be variable, depending on the dates when homes are expected to be completed. Overall, for the 20-year projection period, natural change is projected to average -464 per annum (i.e. identifying more deaths than births) with net migration averaging 1,204 people per annum.

Source: Demographic projections

## Changes to the School-Age Population

3.44 The series of data below looks at projected changes to the school-age population within the Plan area (i.e. excluding the National Park). The data is split into two groups; ages 4-10 (broadly aligning with primary school) and 11-16 (secondary school).
3.45 The table and figure below show projected population change for the population aged 4-10 between 2016 and 2036. Focussing on the Housing Trajectory projection (Projection 2), it can be seen that the number of people aged 4-10 is projected to increase slightly over the first year of the projection and then level off until about 2024; following that, there is projected to be a period of increase to about 2028, before the population aged $4-10$ begins to decline. By 2036, it is projected that the population aged 4-10 will be very slightly lower than in 2016. There are some differences by subarea, with the South Coastal Towns projected to see an increase in the population aged 4-10, and Totton \& the Waterside a decrease.

Figure 3.19: Projected population aged 4-10 - New Forest (excluding National Park) - sub-areas

Source: Demographic projections
3.46 The 'dip' in the number of people aged 4-10 in 2024, is likely to be due to cohort effects rather than any projected change in relation to this particular year (e.g. a smaller cohort of people aged 3 in 2023, as well as being influenced by the population of females of child-bearing age). That said, whilst the graph seems to show a notable 'dip', this needs to be understood in the context of the axis scale being used. Taking the example of PROJECTION 2 (Housing Trajectory) it is the case that the number of people aged 4-10 only falls by 111 from 2021 to 2024 - less than a $1 \%$ change.
3.47 More detailed charts showing the same information for each of the three planning authority subareas can be found in Appendix 1.

Figure 3.20: Projected population aged 4-10 - New Forest (excluding National Park)

Source: Demographic projections
3.48 The table and figure below show the same information for the population aged 11-16. In this case the three projections show a similar pattern, with an increase in numbers to about 2024, and then a levelling off (or slight decline). Focussing on the Housing Trajectory projection (Projection 2), it can be seen by 2036, that the population aged $11-16$ is projected to be around $14 \%$ higher than it was in 2016. For sub-areas, the analysis suggests increases in the population aged 11-16 in South Coastal Towns and Totton \& the Waterside, with a modest decline in Avon Valley \& Downlands.

Source: Demographic projections
3.49 As with the 4-10 age group, more detailed charts showing the same information for each of the three planning authority sub-areas can be found in Appendix 1.

## Changes to Older Person Population

3.50 A similar analysis is provided below to look at changes to the older person population. In this case data is provided for seven age groups. These are:

- 55-59
- 60-64
- 65-69
- 70-74
- 75-79
- 80-84
- 85 and over
3.51 Rather than provide a full series of tables (as with the school age population), the information from these groups is initially summarised in the figure below. This shows a steady increase in the population aged 55 and over from 2016 to 2036; rising from around 60,000 people to $76-77,000$ (depending on the scenario). Within the over 55 age group, the data projects for there to be notable increases in all age groups from 70 onwards, smaller increases in the 60-64 and 65-69 age groups and a slight decline for the population aged 55-59.
3.52 More detailed charts showing the same information for each of the three planning authority subareas can be found in Appendix 1.

## Source: Demographic projections

3.53 As can be seen from the analysis above, there is little difference between the different projection scenarios in terms of older person population growth; this is because older age groups tend to have lower levels of migration, and migration is the key driver of population change in the District. This means that any adjustments to migration in the different scenarios tend to impact to a greater extent on younger age groups (typically people of working age and their associated children).
3.54 The table below provides some more detailed outputs from the projections in terms of older people. Given the comment above about the different projections being broadly similar, data has only been provided from PROJECTION 2 (Housing Trajectory). Additional information about age structure changes for other scenarios can be found in Appendix 2 (and within a series of spreadsheets send separately to the local authority). The analysis shows that all areas are projected to see some ageing of the population and that this looks to be particularly notable in Totton \& the Waterside. Increases in the older person population of the South Coastal Towns looks to be fairly modest, however, this does need to be understood against a background where this area already has a substantially older population structure than other parts of the District.

## Comparison with data from Hampshire County Council

3.55 The projections in this report have been developed independently, drawing on a range of data published by ONS. Separately, Hampshire County Council (HCC) regularly publish their own projections and population estimates; the latest data take a 2016 base. The HCC figures do not typically draw on ONS MYE data and instead takes the 2011 Census population as a start point, and rolls data forward on the basis of dwelling completions (combined with data about the number of births and deaths).
3.56 Given that these alternative figures exist, it is worthwhile providing a brief comparison of the key outputs and below a comparison of the base position in 2016 is shown. The only comparison made in this report is for the base period, as moving forward from 2016, the HCC forecasts and the projections in this report use very different assumptions. It should also be noted that one of the main purposes of the HCC figures is to consider potential demand for school places, there is therefore a particular focus on younger age groups. The comparison provided is for the New Forest excluding National Park areas.
3.57 The analysis below shows, despite the two projections/forecasts using slightly different data sources and methodologies that the base estimates for 2016 are fairly similar. The overall estimates of the total population are only 500 different ( $0.4 \%$ ) whilst the difference in age groups under 20 are also pretty modest. Hence it is suggested that there is a reasonable degree of agreement between analysis and the using the HCC data for the purposes of school place planning remains sound.

Figure 3.25: Comparison of estimated population by age in 2016 (New Forest (ex. NP))

|  | HCC estimate | JGC study | Difference | \% difference <br> from HCC |
| :--- | :---: | :---: | :---: | :---: |
| Age 0-4 | 7,080 | 7,240 | 160 | $2.3 \%$ |
| Aged 5-9 | 7,940 | 7,943 | 3 | $0.0 \%$ |
| Aged 10-14 | 7,338 | 7,486 | 147 | $2.0 \%$ |
| Aged 15-19 | 7,382 | 7,298 | -84 | $-1.1 \%$ |
| Aged 20-24 | 6,556 | 6,513 | -43 | $-0.7 \%$ |
| Aged 25-29 | 6,624 | 7,073 | 449 | $6.8 \%$ |
| Aged 30-34 | 6,795 | 6,712 | -83 | $-1.2 \%$ |
| Aged 35-39 | 7,257 | 7,156 | -101 | $-1.4 \%$ |
| Aged 40-44 | 8,578 | 8,327 | -251 | $-2.9 \%$ |
| Aged 45-49 | 9,864 | 9,795 | -69 | $-0.7 \%$ |
| Aged 50-54 | 10,793 | 10,871 | 78 | $0.7 \%$ |
| Aged 55-59 | 10,042 | 10,010 | -32 | $-0.3 \%$ |
| Aged 60-64 | 9,453 | 9,501 | 48 | $0.5 \%$ |
| Aged 65-69 | 11,066 | 11,145 | 79 | $0.7 \%$ |
| Aged 70-74 | 8,985 | 9,395 | 410 | $4.6 \%$ |
| Aged 75-79 | 7,194 | 7,190 | -4 | $-0.1 \%$ |
| Aged 80-84 | 5,730 | 5,787 | 57 | $1.0 \%$ |
| Aged 85+ | 6,975 | 6,732 | -243 | $-3.5 \%$ |
| All Ages | 145,654 | 146,175 | 522 | $0.4 \%$ |

## Summary

3.58 The main analysis in this report was to develop a series of projections linked to different assumptions. Three projections were developed, two based on demographic-trends and one linking to the Council's housing trajectory. For all of these projections a full set out outputs around population growth, age structure, the components of population change, household growth and housing need has been provided. The projections covered the period from 2016 to 2036.
3.59 The first projection linked to the assumptions in the 2014-based subnational population projections (SNPP). It was observed that ONS are projecting for population growth to be somewhat above past trends, with assumptions about future migration also being higher than has typically been observed in the past. Overall, this scenario (PROJECTION 1A) showed population growth of 18,900 people across the district (excluding the National Park) and 11,700 additional households (which would translate into a need for 601 additional dwellings each year). Population and household growth was projected to be particularly strong in the Totton \& the Waterside area.
3.60 The second projection (PROJECTION 1B), looked at past trends in population growth (2005-15) and modelled data on the assumption that these average trends would be repeated in the future. This projection shows a more modest increase in the population and a greater focus on population growth in the South Coastal Towns sub-area. In terms households, this projection suggested a more even split of growth and housing need (relative to the current number of households in each area). Overall, this scenario suggested a need for around 483 dwellings per annum.
3.61 The final projection (PROJECTION 2) used information from the Council's housing trajectory to model what level of population growth might occur if housing delivery comes forward as expected. Across the planning authority area, this projection sees population growth somewhere in-between that shown by the two trend-based projections, but with some notable year-on-year variations. Overall, this scenario projects a population growth of around 14,900 people, with housing delivery of around 10,600 dwellings.

## 4. Older Persons Housing Needs

## Introduction

4.1 The second main analysis of the study is to provide and update to the analysis and recommendations in the 2014 Strategic Housing Market Assessment (SHMA) on the characteristics of the older population and the likely future need for housing and other forms of sheltered or care accommodation for older people. The analysis in this section has focussed on PROJECTION 2 (linked to the housing trajectory) and largely focusses on the projections developed for the planning authority area of the District.

## The 2014 SHMA

4.2 The analysis in the SHMA initially considered the current population of older persons and contrast this with a range of other areas, before moving on to look at projected changes moving forward. Analysis of 2011 Census data was provided to look at the household composition of older persons, their current tenure and occupancy ratings (the Census data has not changed since the SHMA and so no update is provided). The analysis moved on to look at projected changes to the number of people with a range of health issues, with the final analysis looking at the need for specialist housing.
4.3 This latter analysis drew on information from the Housing Learning and Information Network (Housing LIN) and concluded that there was a need for around 5,000 additional sheltered and extracare units, plus around 2,000 registered care bedspaces (within a C2 use class). Further sub-area analysis identified that much of the need was likely to arise in the South Coastal Towns sub-area.

## Current Population of Older Persons

4.4 Some analysis of the population age structure has been undertaken earlier in this report. In this section, a greater focus is given to age bands within the older age groups (for consistency with the 2014 SHMA, this is taken to be age groups 55 and over). The base data for the current population is taken to be mid-2015, this being the latest date for which information was available at the time of writing.
4.5 The first table below compares the population profile in the New Forest (district) with a range of comparator areas. From this it is clear that New Forest has an old age structure, with $41 \%$ of the population being aged 55 and over, the next highest comparison area is Hampshire with a figure of just $33 \%$. When looking at individual age bands, it is also clear that the New Forest has an 'older' old population, with $9 \%$ of the population being aged $75-84$ and $4.5 \%$ aged $85+$. These figures are important given that projections of the need for specialist accommodation tend to focus on people aged 75 and over.

| Figure 4.1: Older person population (2015) |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | New Forest |  | Hampshire | South East | England |
|  | Population | \% of population | \% of population | \% of population | \% of population |
|  | 105,121 | $58.7 \%$ | $67.0 \%$ | $69.7 \%$ | $71.0 \%$ |
| $55-64$ | 24,447 | $13.7 \%$ | $12.3 \%$ | $11.5 \%$ | $11.3 \%$ |
| $65-74$ | 25,325 | $14.1 \%$ | $11.2 \%$ | $10.1 \%$ | $9.6 \%$ |
| $75-84$ | 16,129 | $9.0 \%$ | $6.6 \%$ | $6.0 \%$ | $5.7 \%$ |
| $85+$ | 8,001 | $4.5 \%$ | $2.9 \%$ | $2.7 \%$ | $2.4 \%$ |
| Total | 179,023 | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ |
| Total $55+$ | 73,902 | $41.3 \%$ | $33.0 \%$ | $29.0 \%$ | $30.3 \%$ |

Source: ONS mid-year population estimates
4.6 At a more localised level, the analysis confirms a particularly old population in the South Coastal Towns, notable within this area is the very high proportion of people aged 75 and over, making up over $18 \%$ of the total population in 2015.

Figure 4.2: Older person population by sub-area (2015)

## Projected Change in the Population of Older People

4.7 As well as providing a baseline position for the proportion of older persons in the District, published population projections and the alternative scenarios developed in this report can be used to provide an indication of how the numbers might change in the future compared with other areas. The initial data provided below is based on the 2014-based SNPP which is the latest source available consistently across areas.
4.8 The data shows that New Forest (in line with other areas) is expected to see a notable increase in the older person population with the total number of people aged 55 and over expected to increase by $28 \%$ over to 20 -years to 2036 . This figure is however lower than projected for other areas. The difference between New Forest and the region is mainly due to the very high proportion of older people currently in the population (which makes higher proportionate increase difficult). The data for New Forest is also notable for showing a small reduction in the population aged 55-64.

| Figure 4.3: Projected Change in Population of Older Persons (2016-36) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | New Forest | Hampshire | South East | England |
| Under 55 | $0.5 \%$ | $0.2 \%$ | $4.3 \%$ | $4.8 \%$ |
| $55-64$ | $-1.3 \%$ | $3.2 \%$ | $13.0 \%$ | $8.3 \%$ |
| $65-74$ | $18.8 \%$ | $26.8 \%$ | $31.9 \%$ | $29.3 \%$ |
| $75-84$ | $50.2 \%$ | $60.5 \%$ | $59.8 \%$ | $54.2 \%$ |
| $85+$ | $105.3 \%$ | $130.7 \%$ | $118.9 \%$ | $113.1 \%$ |
| Total | $12.1 \%$ | $11.5 \%$ | $14.6 \%$ | $13.0 \%$ |
| Total $55+$ | $28.5 \%$ | $33.9 \%$ | $37.9 \%$ | $32.9 \%$ |

Source: 2014-based SNPP
4.9 For individual sub-areas, a similar analysis has been undertaken on the basis of PROJECTION 2 (linked to the housing trajectory). All areas are projected to see an increase in the proportion of people aged 55 and over. The data for the South Coastal Towns is interesting, showing a relatively low growth in the number of older persons. This looks to partly be due to some smaller age cohorts moving through time, but also reflects the earlier finding that this are already has a substantial older person population, by 2036 it is projected that $49 \%$ of the population of the South Coastal Towns will be aged 55 or over, and $23 \%$ aged 75 and over.

| Figure 4.4: Projected Change in Population of Older Persons by sub-area (2016-36) |  |  |  |  |  |  |  |

## Health-related Population Projections

4.10 In addition to providing projections about how the number and proportion of older people is expected to change in the future, analysis can look at the likely impact on the number of people with specific illnesses or disabilities. Consistent with the 2014 SHMA, data is taken from the Projecting Older People Information System (POPPI) website which provides prevalence rates for different disabilities by age and sex. Analysis has focussed on estimates of the number of people with dementia and mobility problems. The analysis has again been based on PROJECTION 2 (housing trajectory)
4.11 For both of the health issues analysed the figures relate to the population aged 65 and over. The figures from POPPI are based on prevalence rates from a range of different sources and whilst these might change in the future (e.g. as general health of the older person population improves) the estimates are likely to be of the right order.
4.12 The table below shows that both of the illnesses/disabilities are expected to increase significantly in the future although this would be expected given the increasing population. In particular there is projected to be a large rise in the number of people with dementia (up 60\%) along with a $61 \%$ increase in the number with mobility problems.

Figure 4.5: Estimated Population Change for range of Health Issues (2016 to 2036)

|  | Type of illness/ disability | 2016 | 2036 | Change | \% increase |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Avon Valley \& Downlands | Dementia | 675 | 1,098 | 423 | 62.8\% |
|  | Mobility problems | 1,341 | 2,315 | 974 | 72.7\% |
| South Coastal Towns | Dementia | 1,555 | 2,160 | 605 | 38.9\% |
|  | Mobility problems | 3,668 | 4,904 | 1,236 | 33.7\% |
| Totton \& the Waterside | Dementia | 1,192 | 2,146 | 954 | 80.1\% |
|  | Mobility problems | 2,786 | 5,088 | 2,302 | 82.6\% |
| New Forest (ex. NP) | Dementia | 3,422 | 5,405 | 1,983 | 57.9\% |
|  | Mobility problems | 7,794 | 12,306 | 4,512 | 57.9\% |
| New Forest NP | Dementia | 861 | 1,460 | 599 | 69.6\% |
|  | Mobility problems | 1,867 | 3,202 | 1,335 | 71.5\% |
| New Forest total | Dementia | 4,283 | 6,865 | 2,582 | 60.3\% |
|  | Mobility problems | 9,661 | 15,508 | 5,847 | 60.5\% |

Source: Data from POPPI and demographic projections

## Need for Specialist Housing for Older Persons

4.13 The 2014 SHMA drew on data from the Housing and Learning Information Network (Housing LIN) to estimate the need for specialist housing for older persons. The latest information (which covers a period to 2035) is presented in the table below. This suggests a need for just under 8,000 units of accommodation, of which around 2,500 are Registered Care bedspaces.

\left.| Figure 4.6: Estimated need for Specialist Housing for Older People - New Forest |  |  |  |
| :--- | :---: | :---: | :---: |
| District (Housing LIN data) |  |  |  |$\right]$. Total need

Source: Housing LIN
4.14 Whilst the Housing LIN data is useful, it is not entirely clear how well it reflects actual local needs; being based, as it is, on a series of national prevalence rates. The use of these rates may in part drive the high level of current need which in reality may not exist to this magnitude. In more recent studies than the 2014 SHMA, analysis has been carried out based on demographic projections (i.e. to essentially ignore if there is any current need) and to project what new need will arise in the future. This approach has been taken in this study, with outputs linked to PROJECTION 2 (housing trajectory).
4.15 For the purpose of analysis, the prevalence rates have been taken from Housing LIN (although, as noted above, it should be remembered that these are national rates). These rates split data between sheltered and extra-care housing and by broad tenure; in reality it may be the case that the Council would seek to provide a higher proportion of specialist housing as extra-care (this is the trend observed nationally over the past few years). The Housing LIN figures are all presented as a rate per 1,000 population aged 75 and over with the base assumptions shown below:

- $\quad$ Sheltered - affordable - 56 dwellings per 1,000 population (including enhanced sheltered)
- Sheltered - market - 89 dwellings per 1,000 population
- Extra-care - affordable - 26 dwellings per 1,000 population
- Extra-care - market - 10 dwellings per 1,000 population
4.16 Additionally, estimates of the need for registered care bedspaces (in a C2 use class) are taken directly from the demographic projections. In this case it is assumed (as it is by CLG in their projections) that the proportion of people (again aged 75 and over) who are living in institutional accommodation will remain roughly the same as at the start of the projection (when data for both sexes is considered together). Hence this proportion (adjusted by area) is applied to the projected increase in the number of people aged 75 and over to give a figure for the C 2 need. For information, the table below shows the estimated proportion of the population in institutional accommodation by age, sex and sub-area, as used in the modelling.

| Figure 4.7: Proportion of population age 75 and over living in institutional accommodation |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Area | Age | Males |  | Females |  |
|  |  | 2016 | 2036 | 2016 | 2036 |
| Avon <br>  <br> Downlands | 75-79 | 1.8\% | 2.2\% | 1.6\% | 1.6\% |
|  | 80-84 | 3.3\% | 3.6\% | 5.1\% | 4.9\% |
|  | 85+ | 9.1\% | 8.7\% | 19.3\% | 17.8\% |
| South <br> Coastal <br> Towns | 75-79 | 1.3\% | 1.6\% | 1.8\% | 1.8\% |
|  | 80-84 | 2.6\% | 2.8\% | 5.7\% | 5.4\% |
|  | 85+ | 8.8\% | 8.5\% | 20.1\% | 18.6\% |
| Totton \& the Waterside | 75-79 | 0.8\% | 1.0\% | 1.4\% | 1.4\% |
|  | 80-84 | 2.4\% | 2.6\% | 4.5\% | 4.3\% |
|  | 85+ | 9.4\% | 9.1\% | 17.7\% | 16.4\% |
| New Forest NP | 75-79 | 1.6\% | 1.9\% | 2.2\% | 2.2\% |
|  | 80-84 | 4.3\% | 4.7\% | 7.6\% | 7.2\% |
|  | 85+ | 12.1\% | 11.6\% | 26.9\% | 24.9\% |

Source: Derived from 2014-based CLG household projections and 2011 Census
4.17 The table below therefore shows the need for specialist accommodation associated with this analysis. Across the planning authority area of the New Forest, this suggest a need for 2,175 dwellings (in a C3 use class) and a further 970 bedspaces in C2 - these figures represent 109 dwellings and 49 bedspaces per annum respectively.

Figure 4.8: Projected need for specialist housing for older persons by sub-area (2016-36)

|  | Avon <br>  <br> Downlands | South <br> Coastal <br> Towns |  <br> the <br> Waterside | New <br> Forest (ex. <br> NP) | New <br> Forest NP | New <br> Forest total |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Sheltered - affordable | 156 | 202 | 361 | 719 | 220 | 938 |
| Sheltered - market | 246 | 318 | 570 | 1,134 | 347 | 1,481 |
| Extra-care - affordable | 44 | 56 | 101 | 201 | 62 | 263 |
| Extra-care - market | 26 | 34 | 61 | 121 | 37 | 158 |
| Total (ex. Reg. care) | 472 | 610 | 1,093 | 2,175 | 665 | 2,840 |
| Registered care | 203 | 342 | 425 | 970 | 423 | 1,394 |
| TOTAL | 675 | 952 | 1,519 | 3,146 | 1,088 | 4,234 |

Source: Demographic projections and Housing LIN
4.18 The total need for specialist accommodation (excluding registered care) can be compared with the total housing delivery proposed in the hosing trajectory to see what proportion of new homes might need to be housing for older people. The proportions in each area are shown below, with the analysis suggesting a need for around a fifth of homes to be specialist housing; the analysis also indicates a slightly higher proportion in the South Coastal Towns and a lower proportion in Avon Valley \& Downlands:

- Avon Valley \& Downlands - 16\%
- South Coastal Towns - 26\%
- Totton \& the Waterside - 20\%
- New Forest (ex. NP) - 21\%
4.19 With regard to the C2 (Registered care) need, it should be remembered that this figure is bedspaces and not dwellings; it would be normal to consider C 2 need and supply separately from other needs (for example in a five-year housing land supply assessment). However, there is arguably some merit in considering how the bedspace need might translate into dwellings, particularly if the Council were to be including C2 needs within the housing land supply calculations.
4.20 There is no fixed methodology for making such a conversion, although some local authorities have considered the occupancy ratings of C3 specialist accommodation; this has typically shown around 1.4 people per dwelling. If this figure were to be applied to the C2 need shown above ( 970 bedspaces) then the equivalent dwelling figure would be 693 dwellings (2016-36) - this is 35 dwellings per annum. It should be remembered that this figure is not included within the main projections developed in this report.

## Summary

4.21 The final section of the report has looked at the potential need for specialist housing for older people. This analysis updates information provided in the 2014 Strategic Housing Market Assessment (SHMA).
4.22 The older person population of the New Forest is proportionately larger than in a range of comparator area (Hampshire, the South East and England), with a particular concentration in older age groups (aged 75+) and the South Coastal Towns sub-area. The older person population is also projected to increase notably in the future, although increases are projected to be of a lesser scale than in other areas (partly linked to the New Forest already having a larger older person population).
4.23 The main analysis focussed on looking at future need for specialist housing (sheltered/extra-care) linked to the projections developed in this report. Using assumptions from the Housing and Learning Information Network (Housing LIN) it was estimated that there is a need for 2,175 additional units of older person specialist accommodation (in a C3 use class) in the 2016-36 period, along with 970 registered care bedspaces (C2 use class) - the first of these figures represents around a fifth of the housing being proposed through the housing trajectory.
